Abdullah Berro

Junior Software Engineer | Full-Stack Developer
Beirut, Lebanon | aboudiberro33@gmail.com | github.com/AbdullahBe11

SUMMARY

Computer Science graduate (LIU, Spring 2026) who led a 6-person team building SkillProof, a live Next.js/TypeScript/PostgreSQL platform where recruiters find candidates through verified project work. Experienced in authentication, role-based authorization, code review, CI and production deployment, with additional personal projects in React/Node.js, Python and Flutter.

EXPERIENCE

Software Engineering Intern (Team Lead), TechTalks Aug 2026 – Oct 2026
SkillProof: Next.js, TypeScript, PostgreSQL (Neon), Prisma, NextAuth, Vercel | techtalks-skillproof.vercel.app

- Led a 6-person team through weekly Jira sprints: planned and sequenced tickets, set up a feature-branch workflow with mandatory pull request review, and managed production deployments on Vercel.
- Reviewed every teammate pull request against its acceptance criteria before merge; for example, caught a setup script that would have deleted most of the project README.
- Owned authentication end to end with NextAuth, Prisma and PostgreSQL: bcrypt password hashing, role-based sessions (candidate, recruiter, verifier), password reset by email, and generic error messages that never reveal which emails are registered.
- Enforced authorization on the server: verifiers cannot approve their own projects or projects without evidence, candidates can only modify or delete their own data, and requests for other users' records return the same 404 as missing ones.
- Built verifier rubric scoring (4 criteria, saved in a single database transaction with the decision), recruiter interest email notifications and tolerant skill search (for example, "nextjs" matches "Next.js").
- Set up GitHub Actions CI running ESLint and Vitest unit tests on every pull request, and managed Prisma migrations safely on a shared PostgreSQL database.

PROJECTS

Algorithmic Trading Engine (personal project)
Python, XGBoost, MetaTrader 5 API, MySQL

- Designed a decoupled architecture that separates the signal model (XGBoost classifier with a 200 EMA trend filter) from order execution through the MetaTrader 5 API, running autonomously on a demo account for XAUUSD, DJ30 and NAS100.
- Implemented layered risk management: ATR-based dynamic stops, an equity cap that halts trading, and scale-out position exits.
- Logged every signal and trade to MySQL for auditing and performance monitoring.

Coffee Shop Ordering System (complete prototype)
React, Node.js, Express, MongoDB, Stripe

- Built a full ordering flow: React storefront with a persistent cart, a Node.js/Express REST API (8 endpoints for menu, orders and payments) and a MongoDB data model.
- Integrated Stripe checkout and automated order-confirmation emails.

Gym Membership Mobile App (personal project)
Flutter, Dart, Firebase

- Built a cross-platform app with Firebase Authentication, Realtime Database for membership management, push notifications for membership reminders and a gamified check-in feature.

Other projects

- **University Scheduling System** (C#, .NET, SQL Server): desktop app with room and time collision detection and optimistic locking for concurrent bookings.
- **Wearable Obstacle Detection Prototype** (C++, Arduino): real-time distance detection with an ultrasonic sensor.

EDUCATION

B.S. in Computer Science, Lebanese International University (LIU), Nabatieh Spring 2026
Relevant coursework: Data Structures & Algorithms, Databases, Web Development, Computer Networks, Mobile Development, Cryptography

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, Java, C#, C++, Dart, SQL
Web: Next.js, React, Node.js, Express, REST APIs, NextAuth, Tailwind CSS, HTML/CSS
Databases: PostgreSQL, Prisma, MySQL, MongoDB, SQL Server, Firebase
Tools & practices: Git, GitHub, GitHub Actions (CI), Vitest, ESLint, Vercel, Jira, Scrum, code review
Other: Flutter, XGBoost, Arduino / embedded C++
Spoken languages: Arabic (native), English (fluent)
