SUMMARY

Computer Science graduate (LIU, Spring 2026) who led a student team building SkillProof, a deployed beta Next.js/TypeScript/PostgreSQL platform where recruiters find candidates through verified project work. Experienced in authentication, role-based authorization, code review, CI and production deployment.

EXPERIENCE

Software Engineering Intern (Team Lead), TechTalks Aug 2026 – Oct 2026

SkillProof (deployed beta): Next.js, TypeScript, PostgreSQL (Neon), Prisma, NextAuth, Vercel

Live: techtalks-skillproof.vercel.app | *Code:* github.com/AbdullahBe11/techtalks-skillproof

- Led a 6-person team (5 after one member left) through weekly Jira sprints: planned and sequenced tickets, set up a feature-branch and pull request review workflow, and managed production deployments on Vercel.
- Reviewed teammate pull requests against their acceptance criteria before merge; for example, caught a setup script that would have deleted most of the project README.
- Built the authentication core with NextAuth, Prisma and PostgreSQL: bcrypt password hashing, role-based sessions (candidate, recruiter, verifier) and password reset with hashed, single-use, expiring tokens; sign-in and reset requests return the same response whether or not the email is registered.
- Enforced authorization on the server: verifiers cannot approve their own projects or projects without evidence (both rules covered by Vitest unit tests), and every project and evidence route checks ownership so candidates can only view, edit or delete their own data.
- Built verifier rubric scoring (4 criteria, saved in one database transaction with the decision), recruiter interest emails and tolerant skill search ("nextjs" matches "Next.js").
- Set up GitHub Actions CI running ESLint, Vitest and a production build on every pull request, and applied Prisma migrations with migrate deploy on a shared PostgreSQL database.

PROJECTS

Personal projects run locally and are not deployed; source code is available on request.

Algorithmic Trading Engine (personal project, demo account) 2026

Python, XGBoost, MetaTrader 5 API, MySQL

- Separated the signal model (XGBoost classifier with a 200 EMA trend filter) from order execution via the MetaTrader 5 API; runs unattended on a demo account for XAUUSD, DJ30 and NAS100.
- Added risk controls (ATR-based stops, an equity cap that halts trading, scale-out exits); logs all signals and trades to MySQL.

Coffee Shop Ordering System (prototype) 2026

React, Node.js, Express, MongoDB, Stripe (test mode)

- Built the full ordering flow: React storefront with a persistent cart, an Express REST API (8 endpoints) on MongoDB, Stripe checkout in test mode and order-confirmation emails.

Other projects

- **Gym Membership Mobile App** (Flutter, Firebase; 2026): sign-in, membership database, push reminders, gamified check-ins.
- **University Scheduling System** (C#, .NET, SQL Server; 2025): booking collision detection with optimistic locking.
- **Wearable Obstacle Detection Prototype** (C++, Arduino; 2025): real-time distance detection with a single ultrasonic sensor.

EDUCATION

B.S. in Computer Science, Lebanese International University (LIU), Nabatieh Spring 2026

Coursework: Data Structures & Algorithms, Databases, Web Development, Computer Networks, Mobile Development, Cryptography

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, Java, C#, C++, Dart, SQL

Web & mobile: Next.js, React, Node.js, Express, REST APIs, NextAuth, Tailwind CSS, HTML/CSS, Flutter

Databases: PostgreSQL, Prisma, MySQL, MongoDB, SQL Server, Firebase

Tools & practices: Git, GitHub, GitHub Actions (CI), Vitest, ESLint, Vercel, Jira, Scrum, code review

Spoken languages: Arabic (native), English (fluent)
